Resistance changes with temperature. There are three circumstances under which resistance can be measured:

1. Room temperature (before use): nominal ohms are 90% of Ohm's law calculation.
2. Room temperature (after use): nominal ohms are 95% of Ohm's law calculation.
3. At temperature (during use): depending on application nominal ohms are approximately 100% of Ohm's law.

Note: Resistance and wattage values are approximate depending on application conditions.

1	0.996 (25.3)	$1\frac{1}{4}$ (32.0)	72 (1830)

Indicates recommended maximum sheath length; however, longer lengths may be available.

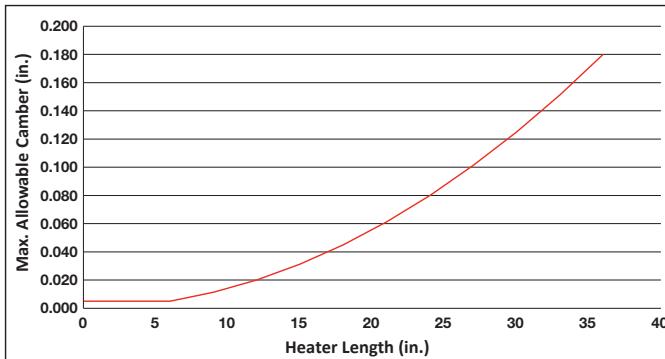

Camber

Camber is defined as the maximum deviation of the heater's centerline from straight. FIREROD camber within allowable tolerances is verified via passage through a cylindrical gauge of specified length and diameter. Normally, slight camber does not present a problem since the heater will flex enough to fit into a straight, close-fit hole.

Camber Measurement

Allowable Camber Versus Length

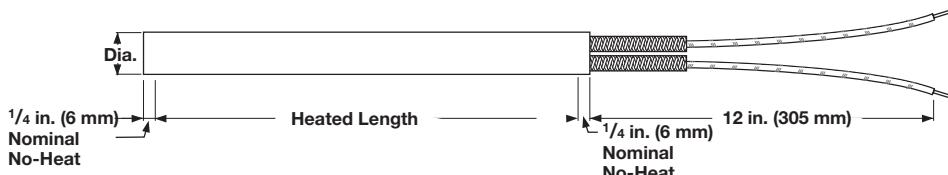

Max. camber = $0.020 \text{ in.} \times (\text{length in feet})^2$ or 0.005 in. , whichever is greater.

^① Determined by the current carrying capacity of internal parts and lead wire. Alternate material may be available.

^② For 1/4 in. (6 mm) units with thermocouple maximum amperage is 3.1A.

^③ Determined by the limitation of space for resistance winding. For minimum wattage of 240VAC multiply value by four.

^④ Higher wattages are available using more than one set of power leads. Multiply the wattage from the table by the applicable factor.

^⑤ Contact your Watlow representative for data.

^⑥ On 3/4 in. (19 mm) diameter units, either three single-phase circuits or one three-phase delta or wye circuit is available. On 1 in. (25 mm) diameter units, either five single-phase or two three-phase delta circuits are available.

^⑦ A minimum charge per line item applies.
